### Lubricants in KRONES AG Labelling Machines

Dear Mr. MacDonald,

Many thanks for your overview of products which are comparable to those in our "Lubricant Table For Bottling Lines."

Taking up your initiative, we checked the technical documents belonging to your INDUSTRIAL LUBRICANTS.

We established that all of the products fulfil the lubrication requirements produced by the labelling machines which we manufacture (as per DIN standard).

Therefore, we consider the LE lubricants which we checked as being suitable for use in our installations and will include them among our recommended lubricants – within the framework of the quality guarantee and product liability of LE and on condition that the correct viscosities and consistencies are selected (please refer to our recommendations).

It is not possible to include your oils and greases in our lubricant table at the moment as reprint is not anticipated.

Should you intend to post-lubricate KRONES machines with a mixture of your products and the previously used lubricants, we would first like to point out as a matter of form that the compatibility of the lubricants must firstly be clarified. If perfect compatibility cannot be proven, the bearings, lubrication lines, grease fittings, etc., must be completely cleaned and refilled. Should cleaning not be possible, we would ask you to point out the possible problems to the customer and reject any form of guarantee.

Kind Regards,

KRONES AG
